AI-Powered Student Planner and Task Management System

Team Members: **Saniya Hosseini, Negar Salimi**

Professor: **Dr. Mahdi Molai**

October 2026

1. Project Vision

The goal of this project is to design and develop an AI-powered web application for student task management and academic planning. The application will provide a centralized platform for managing assignments, exams, weekly class schedules, and study sessions, along with a Jalali calendar, deadline reminders, and progress reports. An integrated AI assistant will help students organize their academic workload, answer questions about their schedules, suggest study plans based on their available time and priorities, and identify upcoming deadlines. The assistant will interact with the application's data, with the user's permission, to provide personalized and context-aware recommendations. The system aims to make academic planning more organized, accessible, and efficient through a combination of conventional task management features and AI-powered assistance.

2. Target Audience

The primary target audience consists of university and college students who need to manage multiple courses, assignments, examinations, and study activities throughout an academic semester.

- **University students:** Students who need to organize assignments, exams, and academic deadlines.
- **Students with busy schedules:** Students who need to coordinate classes, study sessions, and other responsibilities.

- **Students who need planning assistance:** Students who want help prioritizing tasks and creating realistic study schedules.
- **Students who prefer personalized guidance:** Students who want to interact with an AI assistant to review their workload and receive recommendations based on their academic plans.
- **Persian-speaking students:** Students who prefer a Jalali calendar and a localized interface.

The initial version will focus on individual students. The AI assistant will support academic organization and planning rather than replace instructors, provide guaranteed academic outcomes, or make official university decisions.

3. Core Features: User Stories

The core features of the proposed system are defined through user stories that describe the system's functionality from the student's perspective. These stories are organized into two categories: core application features and AI assistant features, covering academic task management, planning, and AI-powered assistance.

3.1. Core application features

User Story 1: User Registration

As a student, I want to create an account so that I can manage my personal academic information.

User Story 2: Secure Authentication

As a student, I want to log in and log out securely so that my academic data remains private.

User Story 3: Course Management

As a student, I want to add, edit, and delete courses so that I can organize my academic activities by subject.

User Story 4: Assignment and Exam Management

As a student, I want to create and manage assignments and exams with deadlines, priorities, and descriptions so that I can keep track of my academic responsibilities.

User Story 5: Task Status and Priorities

As a student, I want to update task statuses and assign priorities so that I can identify and monitor my most important activities.

User Story 6: Jalali Calendar

As a student, I want to view my tasks, exams, and study sessions in a Jalali calendar so that I can plan using Persian dates.

User Story 7: Weekly Class Schedule

As a student, I want to create and view my weekly class timetable so that I can coordinate my classes and study sessions.

User Story 8: Study Session Planning

As a student, I want to schedule study sessions for different courses so that I can allocate time for studying in advance.

User Story 9: Deadline Reminders

As a student, I want to receive reminders about approaching deadlines so that I can stay aware of important academic activities.

User Story 10: Progress Dashboard

As a student, I want to view statistics about completed, pending, and overdue tasks, as well as my recorded study time, so that I can monitor my progress.

3.2. AI assistant features

User Story 11: AI Chat Assistant

As a student, I want to communicate with an AI assistant through a chat interface so that I can ask questions and receive help with academic planning.

User Story 12: Schedule-Aware Assistance

As a student, I want the AI assistant to access my relevant tasks, exams, and class schedule, with appropriate authorization, so that it can provide recommendations based on my actual workload.

User Story 13: Personalized Study Plan Generation

As a student, I want the AI assistant to suggest a study plan based on my available time, upcoming exams, task deadlines, and course priorities so that I can organize my study activities more effectively.

User Story 14: Task Prioritization Recommendations

As a student, I want the AI assistant to recommend which tasks I should focus on first based on urgency, deadlines, and importance so that I can make better planning decisions.

User Story 15: Natural Language Task Management

As a student, I want to describe a task in natural language, such as "Remind me to finish my database assignment by Thursday," so that the assistant can help me create a structured task with the appropriate details.

User Story 16: Upcoming Deadline Analysis

As a student, I want the AI assistant to summarize my upcoming deadlines and identify potentially conflicting commitments so that I can prepare in advance.

User Story 17: Study Plan Adjustment

As a student, I want the AI assistant to suggest adjustments when I miss a study session or when my schedule changes so that I can maintain a realistic study plan.

User Story 18: Study Progress Insights

As a student, I want the AI assistant to interpret my task completion and study-time statistics so that I can identify planning patterns and receive suggestions for improvement.
